

Multi-Agent Orchestration: The Governance Complexity Layer

When AI agents coordinate, new risks emerge: identity sprawl, cascading failures, and emergent behaviors that no single agent was designed to produce.

HOW RISKS CASCADE IN ORCHESTRATION

THE ORCHESTRATION GOVERNANCE GAP

WHEN ORCHESTRATION FAILS

CASCADING

87% Contamination

A single poisoned agent contaminated 87% of downstream decisions in 4 hours across a multi-agent research simulation.

IDENTITY SPRAWL

47 Agent Identities

Auto-scaling incident created 47 agent identities across 12 cloud services, making audit trail reconstruction impossible.

EMERGENT LOOP

180K API Calls in 6h

Two agents in a group chat pattern entered a refinement loop, generating 180,000 API calls. Cost: \$18,000 before detection.

Governance Requirements

POLICY

- ✓ RACI matrix per agent role
- ✓ Inter-agent communication policies

TECHNICAL

- ✓ Chain-level observability & tracing
- ✓ Circuit breakers & cost guardrails

OPERATIONAL

- ✓ Orchestration kill-switch
- ✓ Regular chaos testing

Multi-agent systems require multi-layer governance.

Governance Mastery Training covers orchestration-specific frameworks and controls.
